

Taking the measurements and adjusting the **IDC®POWERHARNESSES CORRECTLY**

TAKING THE MEASUREMENTS CORRECTLY

Choosing the correct size ensures maximum freedom of movement and protects the neck and shoulders. In order to select the correct size, it is essential to measure accurately. The girth of the dog is to be measured behind the front legs, approximately four fingers away from them for sizes 0/M, 1/L, 2/XL, 3/2XL and 4/3XL, and two fingers away from them for sizes Baby1/3XS, Baby2/2XS, Mini-Mini/XS and Mini/S.

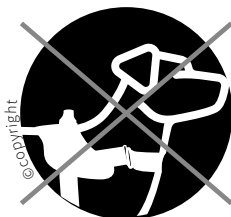

PUTTING ON THE DOG HARNESS

When putting on the harness, special attention should be paid to the correct adjustment of the chest strap and the girth strap. The girth strap is adjusted correctly if you are able to slide your flat palm under the harness on the back of the dog. There should be room for four fingers behind the front legs in case of sizes 0/M, 1/L, 2/XL, 3/2XL and 4/3XL, and two fingers away from them for sizes Baby1/3XS, Baby2/2XS, Mini-Mini/XS and Mini/S.

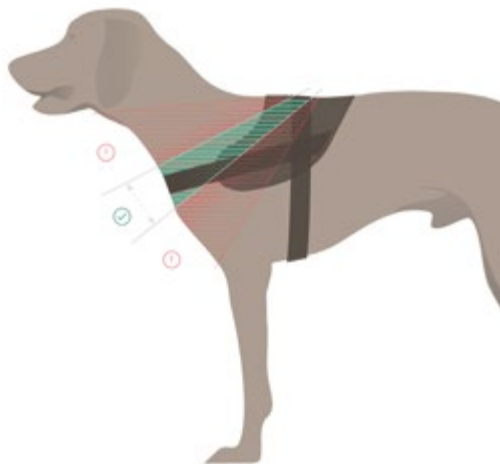

CHOOSING THE CORRECT HARNESS SIZE IS ESSENTIAL FOR SAFE AND COMFORTABLE USE.

Attention! Choosing a wrong harness size or incorrect adjustment may result in injury or the dog sliding out of the harness. If the harness is too small, the chest strap may squeeze the neck of the dog and put the pressure on it instead of distributing the force around the chest area. If the harness is too big or the straps are too loose, the dog may step over the chest strap with its front legs.

The right harness size should leave enough room in the shoulder area and the dog should be able to move its legs freely.

GREEN ZONE DESIGN PRINCIPLE: FREE MOVEMENT. FREE BREATHING.

Unlike collars, the special angle of the chest strap allows IDC®Powerharness to rest on the ideal zone of the chest. This completely frees your dog's neck for healthy, unrestricted breathing while ensuring free movement for the front legs.

Julius-K9® will not take any responsibility for damage arising from choosing a wrong harness size or adjusting the harness incorrectly.
